# DURel Annotation Tool Prospects on a Workbench for Lexicographers

October 19, 2022

#### Dominik Schlechtweg, Maike Park

Institute for Natural Language Processing, University of Stuttgart Leibniz-Institute for German Language, Mannheim

### Motivation

common problem:

- given: set of word uses (corpus)
- searched: their meanings and their relations
- relevant for:
  - historical linguistics
  - lexicography
  - digital humanities
- common approach: researcher scans corpus himself
  - tedious
  - subjective
  - no protocol
  - bias
- solution: DURel Annotation Tool<sup>1</sup>
  - online interface
  - upload word uses for annotation
  - well-established protocol for contextual word meaning annotation (Erk et al., 2013; Schlechtweg et al., 2020)

Table 1: Sample of diachronic corpus.

#### Annotation

- (A) [...] and taking a knife from her pocket, she opened a vein in her little arm, and dipping a feather in the blood, wrote something on a piece of white cloth, which was spread before her.
- (D) It stood behind a high brick wall, its back windows overlooking an arm of the sea which, at low tide, was a black and stinking mud-flat [...]

### Scale

- 4: Identical
- Closely Related
   Distantly Related
  - 1: Unrelated

Table 2: DURel relatedness scale.

#### Graph representation

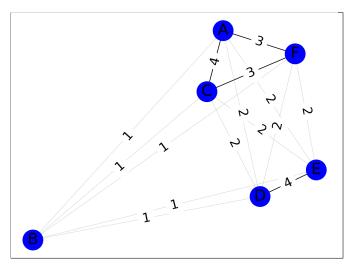

Figure 1: Word Usage Graph of English arm.

## Clustering

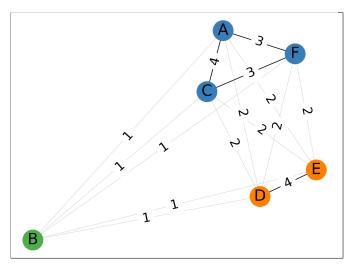

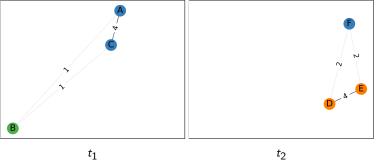

Figure 2: Word Usage Graph of English arm.

### Lexical Semantic Change

 $t_2$ 

Case Study: Lexical Semantic Change Discovery

- Kurtyigit et al. (2021)
- focus on change discovery:
  - discovering novel word senses over time in a diachronic corpus pair
  - evaluating visualizations of the annotated data from a lexicographer's point of view (how intuitive is it? are clusters conclusive? annotations reliable?)
- results:
  - high-quality predictions, high inter-annotator agreement
  - useful visualizations of clusters and relations
  - detection of previously undescribed changes that weren't included in dictionaries

## Case Study: Lexical Semantic Change Discovery

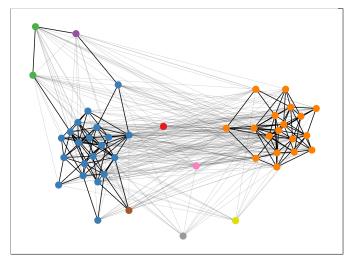

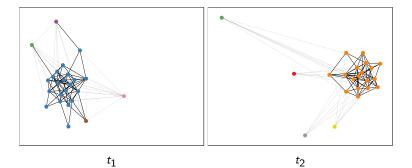

Figure 4: Word Usage Graph of German Zehner.

## Case Study: Lexical Semantic Change Discovery

Case study: Polysemy/Synonymy across Language Varieties

- Baldissin et al. (2022)
- Diatopic lexical semantic variation in Spanish
- extend DURel framework to onomasiological questions

## Case study: Polysemy/Synonymy across Language Varieties

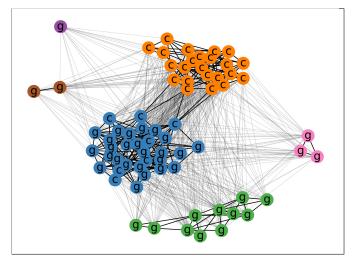

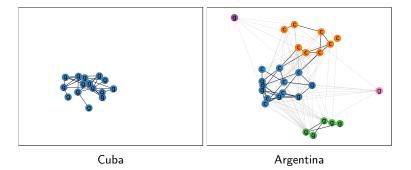

Figure 6: Word Usage Graph of Spanish *colectivo* and *guagua*.

# Case study: Polysemy/Synonymy across Language Varieties

- shared task on LSCD in Spanish (D. Zamora-Reina et al., 2022)
- Norwegian LSCD data set

(Kutuzov et al., 2022)

two ongoing studies from NLP and literary studies

## Conclusion

#### inter-subjectivity:

- avoids experimenter bias through standard protocol and annotation by multiple humans
- inter-annotator agreement gives measure of reliability
- simple:
  - the judgment of use pair relatedness is an intuitive task for annotators generally yielding high agreement (Erk et al., 2013; Schlechtweg et al., 2018)
  - annotated data can be visualized as semantic relatedness graphs on 2D plots

#### preparation-lean:

researchers only need to sample word uses

#### grounded in theory:

 relatedness judgments have theoretical basis in cognitive semantics (Blank, 1997; Schlechtweg et al., 2018)

#### flexible:

 clustering algorithm and parameters can be changed after annotation, avoiding re-annotation

### General extensions

- Optimized sampling
- Upload of data (use pairs for annotation and gold data of annotation)
- Annotation history + modifying previous annotations
- Computational Annotator
- Statistics page with annotator agreement
- Clustering methods (interface)
- Clustering visualization/analysis
- Automate prediction process for modern corpora

#### Extension to other tasks and fields

- traditional sense definition annotation
- use pair annotation with relation labels
- generalization of annotation scale

### Lexicographic extensions

- automatic use extraction from corpora
- detection of number of senses per word
- detection of representative examples of senses
- possibility of modifying annotated data, interface
- possibility of modifying inferred sense structures (lumping/splitting of senses)
- possibility of exporting data in dictionary format ("Wörterbuch-Redaktion"); XML format is generally used;
- semantic change monitoring, large-scale annotation of random data (disagreement between users, not normally currently done, but future avenue)
- detection of multi-word units

#### Direct research application

- need for automation
- multiple cross-connected research lines in our project
- unique opportunity to make our research useful

## Funding

▶ software engineer 75% for two years
